WHAT IT IS

A screening pipeline for importing vehicles: parse the listings, apply hard gates, score what survives, and report. The strategy itself lives in one configuration file, so tuning the decision means editing criteria rather than rewriting logic. The landed-cost model uses duty rates checked against the statute, and the output includes the full kill log - every rejection with the reason it was rejected.

WHAT IT CHANGES

The strategy is a file you can read, argue with and version

Every rejection is recorded, so the shortlist can be audited

True landed cost, not the listing price, drives the ranking

Python standard library · JSON criteria · cost model

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
