DOMAINS COVERED

WHAT IT IS

Project state lives in plain markdown instead of inside one vendor's product. A generated map points to one page per project, and each page points at the real folder. An assistant reads two files to get oriented rather than scanning a workspace.

WHAT IT CHANGES

Switch AI tools without losing a single note

Cheap to read: a map, then one page, then the work

Standing rules travel with the context, so corrections stick

Markdown · Python generator

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
