

Five Gates working protocol

Make an AI show its work before you trust the answer.

SHIPPED · INJECTABLE ONE-PAGE CARD

SCHEMATIC

01	Scoping	define done as a test
02	Evidence	observed, inferred or assumed
03	Adversarial	prosecute your own plan
04	Verification	exercise the real flow
05	Reporting	finished, or not finished

Nine standing habits underneath, and a one-page injectable card.

INJECTABLE CARD

WHAT IT IS

The working discipline of a careful analyst, written down so any model can follow it: scope the task as a testable outcome, verify that the things being named actually exist, prosecute your own plan before defending it, exercise the real flow end to end, then report outcome-first with an explicit finished or not finished. Evidence is labelled observed, inferred or assumed - which is the line most confident wrong answers cross.

WHAT IT CHANGES

- Confident-but-wrong output gets caught at the evidence gate
- Smaller models print gate receipts, so their reasoning is auditable
- Corrections become numbered amendments, so the protocol improves instead of repeating
- Markdown protocol · runtime-agnostic

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
