## WHAT IT IS

A library of visual automations covering the recurring shapes of information work: scheduled newsletters assembled from sources on statistics, regional tourism and markets; chat-driven agents that answer from a calendar or a listing; and a content pipeline that adapts one piece across several platforms. Built as flows so they can be handed to someone who does not write code.

## WHAT IT CHANGES

A recurring digest assembles itself on schedule instead of on a free evening

Flows are readable, so a non-developer can maintain one

Each automation is one file, portable between hosts

n8n · webhooks · scheduled triggers

SOMETHING LIKE THIS, FOR YOUR WORK?

## The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
