

Brand fidelity control

Stop generative tools from quietly redesigning someone's brand.

SHIPPED · ENFORCED ON EVERY GENERATED ASSET

BEFORE DELIVERY

WHAT IT IS

Generative image and video tools produce output that looks plausible and is subtly wrong: a mangled wordmark, an invented tagline, a second logo in frame, a product whose silhouette changes between scene two and scene five. This treats the brand reference as a specification. Copy is verbatim or it does not ship, unknown values are asked rather than guessed, and nothing is delivered until the rendered file has actually been opened and checked.

WHAT IT CHANGES

Brand copy is never paraphrased, translated or invented

Product structure stays identical across every scene of a set

A generation link that nobody looked at is not treated as a deliverable

Markdown specification · generation CLI · review gate

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
