MONITOR

Local

FIRST

WHAT IT IS

A local operations surface that puts project state, live terminals, files, agent activity and execution queues in one place, across several monitors. It is not a mockup; it is the interface used to run the rest of this work.

WHAT IT CHANGES

Stop hunting across windows for what is running and what is stuck

Detachable panels, so a second monitor becomes real workspace

Every long job stays visible and recoverable instead of silently dying

Python · HTML · JavaScript · WebSockets

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
