EXTERNAL APIS

WHAT IT IS

A single-file dashboard that takes a local bank's CSV export - with its own encoding quirks and padded description fields - categorises every transaction by rule into five buckets and twenty-plus subcategories, and compares the result against an editable budget. Uncertain matches are flagged for review rather than guessed. The insight engine is rules in code, not a language model, so the app is self-contained and costs nothing to run.

WHAT IT CHANGES

Ambiguous transactions are surfaced for a decision instead of silently bucketed

The budget model is editable, so it fits a real income instead of a template

No external service sees the bank statement

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
