OUTPUT FORMATS

WHAT IT IS

Official taxi tariffs are published as a wall of numbers in a PDF, which makes them impossible to compute with. This turns them into two machine-readable tables - a long format for analysis and a wide format matching the printed layout - generated from a build script so the dataset can be regenerated when the tariff changes. The surcharge, luggage and waiting-time conditions are captured as documented rules instead of being lost in the conversion.

WHAT IT CHANGES

Fares become queryable data rather than a picture of a table

Both layouts come from one script, so they cannot disagree

The conditions that change the price are captured, not dropped

Python · CSV · public tariff source
