

Investment screening system

Score candidates against a written thesis, then stop before the buy.

METHOD RUN · WATCHLIST PRODUCED

SCHEMATIC

Six trends researched, 21 candidates scored. It stops before the buy.

AUTOMATED PURCHASES

WHAT IT IS

A screening method built around one thesis - own the enabling infrastructure of a trend rather than guessing which company wins it - applied across several trends and turned into a ranked, scored watchlist. It has a hard comprehension gate: nothing reaches the list unless it can be explained in three sentences. The system deliberately stops at scored candidates and leaves the buy decision to a person.

WHAT IT CHANGES

Removes the hardest question - which company wins - from the bet entirely

A pick you cannot explain in three sentences is rejected by rule

Ends at a ranked watchlist, so no automation ever places an order

Markdown method · agentic research · scoring rubric

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
