v2

REBUILT ON A FIXED MODEL

WHAT IT IS

A remote-first opportunity pipeline built on employers' own structured endpoints rather than scraped listings, with an eligibility filter and staged scoring so only genuinely viable roles reach the shortlist. Rebuilt from scratch after the first version encoded a false constraint that silently removed an entire continent.

WHAT IT CHANGES

Structured sources instead of brittle scraping

Eligibility applied first, so the shortlist is real

Staged scoring: cheap filters before expensive judgement

Python · structured job endpoints

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
