Spec

EXECUTABLE BY ANY BUILDER

WHAT IT IS

A build specification for the failure mode where the strongest executor absorbs everyone else's work: accountability never forms, the team never develops, and it looks like success from above. The design answers it with a commitment ledger, a tripwire at the moment of absorption, a written rule for coach-versus-escalate, and a weekly rhythm short enough to survive a busy week. It is published here as architecture, not as a running system.

WHAT IT CHANGES

- Names the load-bearing adoption risk in the spec instead of discovering it later
- Every stored note must be an observable fact the named person could read
- Personnel-adjacent data never leaves the machine, by design
- Product specification · file-based data contract

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
