WHAT IT IS

Long-running work is scheduled to execute overnight on the machine itself, and the result is waiting on the phone by morning. The queue stays visible so a job that failed is obvious rather than silently missing. The worker is deliberately given no delete and no edit rights: it proposes, a human applies.

WHAT IT CHANGES

Hours of processing happen while you sleep

The outcome arrives where you already look in the morning

Missed runs are visible and re-runnable, not lost

Python · task scheduler · messaging delivery

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
