

Portable AI behavior layer

Write your operating rules once, run them on any model.

SHIPPED · EVERY CONFIG FILE IS GENERATED

SCHEMATIC

The build refuses to ship on drift, bad encoding or a leaked vendor name.

BUILD CHECKS BEFORE
SHIPPING

1

SOURCE OF TRUTH

WHAT IT IS

Instructions, standing rules and reusable skills live in one canonical source. A build step compiles that source into the configuration file each runtime expects - and refuses to ship if the source has drifted, if a heading no longer matches, if the encoding would mangle Spanish characters, or if a vendor's name leaked into text meant to be portable.

WHAT IT CHANGES

One edit propagates to every AI tool you use, instead of four divergent copies

Vendor lock-in becomes a build target rather than a rewrite

Hand-edited generated files are detected and archived, so drift cannot go quiet

Markdown · Python generator · lint and parity checks

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
