

Production standard for statistical products

Any product, one entry file, and you know exactly where you are.

PILOTED ON TWO PRODUCTS

SCHEMATIC

01	State file	status, next action, current version
02	Folder + version rules	same shape in every product
03	Transfer packet	checksums and a log
04	Publication packet	ready to hand over

Enter any product through one file. Never reconstruct from filenames.

1

STATE FILE PER PRODUCT

LAYERS: FOLDERS, VERSIONS,
TRANSFER, PUBLICATION

WHAT IT IS

A folder, versioning, transfer and publication-readiness standard for recurring statistical products. Every product is entered through a single state file that states current status, next action and where the current version lives - so a colleague, a successor, or the same person six months later does not have to reconstruct context from filenames.

WHAT IT CHANGES

One file to read before touching a product, instead of guessing from folders

Transfers carry checksums and a log, so a stale copy is detectable

Handover becomes a packet, not a conversation you have to be present for

Markdown standard · checksums · transfer manifests

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
