WHAT IT IS

A reusable pattern for the specific failure of writing an excellent methodology and never running it. Six parts - the method document, an orchestrator, a fan-out of subagents over the repetitive unit of work, a scheduled trigger, one human gate, and an optional output layer - so a method executes itself and produces scored candidates without being babysat.

WHAT IT CHANGES

A written method starts producing output instead of sitting unrun

The repetitive unit fans out in parallel rather than being ground through

The decision that matters stays human by construction, with no account access

Agentic orchestration · scheduled trigger · Markdown method
