

Read-only system advisor

Find out what is slowing your machine before you change anything.

V0.1 SHIPPED · READ-ONLY PROOF PASSING

SCHEMATIC

Read-only proved by hashing the machine before and after. Passed twice.

0	35	15	2 / 2
MACHINE CHANGES IN V0.1	CATALOGUED COMPONENTS	FINDINGS ON THE FIRST SCAN	READ-ONLY PROOFS PASSED

WHAT IT IS

A scanner and advisor for a Windows machine: processes, startup items and services, matched against a catalogue of known components and turned into recommendations that state the trade-off rather than telling you to disable things. Version one has no actuator file at all, and a test harness hashes the machine before and after each scan to prove nothing was touched.

WHAT IT CHANGES

Recommendations name the cost of taking them, not just the benefit

Read-only is proved by a hash comparison, not asserted in a README

An unknown component is investigated, never disabled on a guess

PowerShell module · CIM collectors · JSON catalogue

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
