

Statistical pipeline engineering

Move a legacy process to a new tool and prove nothing changed.

WHAT IT IS

An eight-stage legacy statistical workflow translated into a parameterized modern pipeline, with the analyst's judgement calls pulled out of the code and into configuration. Every original dataset stayed untouched, and the translation was proven rather than asserted.

WHAT IT CHANGES

Parity checked value by value, so the migration is defensible

Analyst decisions live in configuration, not buried in code

Originals are read-only by construction, never written back to

R · SPSS · reproducible QA

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
