PUBLICATION

WHAT IT IS

A national tourism survey moved from a commercial data-collection product onto an open-source one, and is now collecting live. The decisive design choice was to leave the existing analysis untouched: a generated pre-processing step reshapes the new export into exactly the contract the old syntax already expects, so the statisticians' code did not have to be rewritten or re-validated.

WHAT IT CHANGES

The analysis code did not change, so nothing had to be re-approved

A laptop and a manual workbook came out of the monthly loop entirely

Column naming is generated from one table, so the form and the pipeline cannot drift apart

XLSForm · SPSS syntax generation · Python verifier

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
