WHAT IT IS

A parser and scorer over a plain-text task file that sorts everything open into six buckets - do now, next, delegate, waiting, defer, drop - and pairs the top items to the energy they actually require, so a demanding task does not land at the end of a long day. It never modifies the source file.

WHAT IT CHANGES

A triage in seconds instead of re-reading the whole list

Delegate and drop are real outputs, not aspirations

Read-only on the source, so the task list stays the human's

Python standard library · Markdown task file

SOMETHING LIKE THIS, FOR YOUR WORK?

The interesting part is your version of the problem.

Tell me the workflow that costs you the most time or the most trust. I will tell you honestly whether a system fixes it.
